1. Introduction

This website basically searches for a restaurant particularly in a country. There is a search bar which the users can utilize to pinpoint their own area/city. The goal of this project is to make accessing the menu of the restaurants easier as some restaurants don't have websites or don't have menus that are available in the internet.

This application can make the users ready before entering the said restaurant thus, the restaurant will have the benefit of being more efficient with their customers. The users will also be more efficient in choosing, and will spend lesser time looking for restaurants that fit their needs.

2. Expected List of Features

A search bar that you can utilize to search your area for restaurants. This is important as it can minimize the time searching for your own city/area when using the wide scope of restaurants tab.

The wide scope of restaurants tab which has the information as to what restaurants are in each of the cities. This is important if the user doesn't know what restaurants are in the city.

The website only has 3 pages, the restaurants page, the restaurant itself, and the home page.

3. Market Survey

Some of these applications require a login which my website doesn't have since once of its goals is being user-friendly and easy to use. Also, some of these websites have mobile applications which my website doesn't have. Their website also has categories, which may be hard to incorporate with my website as my website provides users a fast-use type of website which doesn't include so many features.
