# Ideation

Status	To Do 2

describing the general idea of your project, the expected list of features and a survey of existing projects, websites and/or apps that are similar to your ideas and/or have some features similar to your proposed project.

General Idea

This project will provide a particular app a website wherein it can be downloaded from there. Without this website, the app cannot be accessible anywhere else thus, the need of the website. The website will also be used to entice the consumers to download the app.

Features

The app will be simple, having a navbar that consists of Home, Support, Download. The home will be rendering the first thing that the users will see, which will consist of the description of the app and the reason to download it. The support route will be for the FAQ for the application and the contact details. The download route will be where the consumers can click a button to download the app.

Survey

The websites I listed below is quite the same with the function of my website which is, to download the specific app on that website. Some of the websites don't have an FAQ which is quite unique from mine but most of them has a download route, which is quite self-explaining since it is better to pitch your app to the consumers first before letting them download.
